Narrative

1.0 Design Description

The T56 turboprop engine is an internal-combustion, gas turbine, aircraft primary power plant manufactured by Detroit Diesel Allison Division of General Motors Corporation in Indianapolis, Indiana. Engine power is developed by the compression of ambient air by an axial compressor and the introduction of fuel with the compressed air. The fuel-air mixture is ignited and the resultant high velocity gases pass through a turbine. The energy of the gas is extracted and converted into a usable form by the turbine to drive engine components and a constant-speed variable-pitch propeller. The engine is essentially a constant-speed unit with the propeller acting as the governor. Power from the engine is converted to thrust, principally by the propeller, with some additional jet thrust provided by the high velocity exhaust gases. The engine also provides bleed-air for operation of engine anti-icing, pressurization, and compressor unloading during the engine start cycle.

The major components which physically make up the T56 engine include a gas turbine power unit assembly connected to a reduction gear section via a torquemeter section and supporting structure (see Figure 1). In addition to the reduction gear and torquemeter sections the power unit assembly contains four sections: a compressor section, a combustion section, a turbine section, and an accessory drive section which is mounted on the bottom of the forward end of the compressor section.

Integral accessory systems of fuel/control, lubrication, electrical, ignition, bleed-air, and water/alcohol injection* provide for coordinated control of engine operation. Hoses, tubing, and electrical wiring interconnect the various equipment which support operation of the engine accessory systems.

* Water/alcohol injection is used on the T56-A-10WA engine only.

MAJOR T56 ENGINE COMPONENTS (TYPICAL)

T56 Turboprop Engine

Nomenclature/Designation

Revision Number

Narrative (continued)

Numerous models of the T56 turboprop engine have been placed into both commercial and military service. Current usage and related maintenance responsibility by the Navy is limited to only seven models installed in four series of aircraft -- the C-2, C-130, E-2, and P-3. These T56 engine models, which are covered in this maintenance plan, and their aircraft application are identified in Table 1.

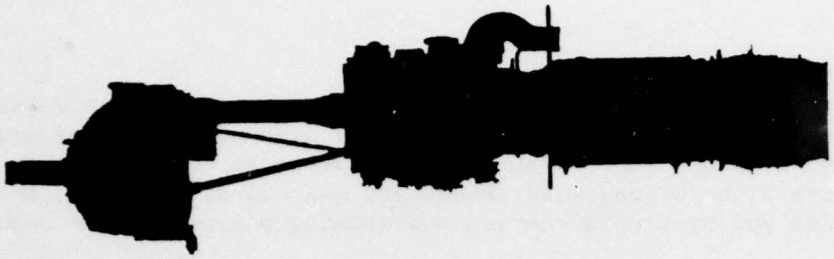
TABLE 1

T56 ENGINE APPLICATION

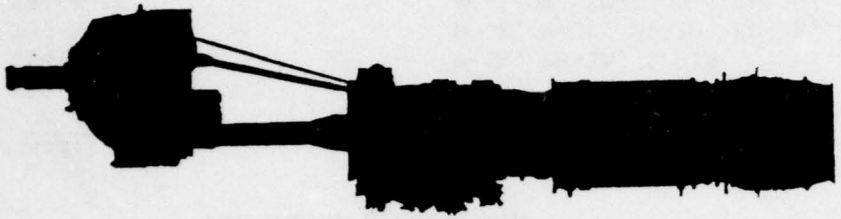
Model	Aircraft
T56-A-7A	C-130F
T56-A-10WA	P-3A, EP-3A, RP-3A
T56-A-14	P-3B, P-3C, EP-3B, EP-3E, RP-3D, YP-3C
T56-A-16	KC-130F, KC-130R, LC-130F, LC-130R
T56-A-423	EC-130G, EC-130Q
T56-A-425	E-2C, TE-2C
T56-A-426	C-2A, E-2B, TE-2A

One of the primary differences to be observed between the various models is the physical orientation of the reduction gear section for engines installed in the P-3 and those installed in other aircraft (see Figure 2). Engines installed in the P-3 are characterized by their reduction gear section having the torquemeter section connected high (pinion high) while the reduction gear section on engines installed in the C-2, C-130, and E-2 aircraft has the torquemeter section connected low (pinion low).

Narrative (continued)



(P-3 AIRCRAFT, PINION HIGH)



(C-2, C-130 & E-2 AIRCRAFT, PINION LOW)

FIGURE 2

T56 TURBOPROP ENGINE CONFIGURATIONS

Narrative (continued)

Principal configuration differences between individual engine models are as follows:

a. The T56-A-10WA engine incorporates water/alcohol injection to gain a higher power rating for takeoff.

b. The T56-A-7A, -10WA, and -426 engines use an internal diffuser assembly scavenge pump and turbine front scavenge pump, and a series II turbine.

c. The T56-A-14, -16, -423, and -425 engines provide a higher power rating through use of a redesigned series III turbine. Also these engines use an external scavenge oil system.

d. The T56-A-423 engine has an additional accessory gear train installed in its reduction gear section to reactivate an existing pad position to drive an extra alternator.

Other differences to be observed between engine models are less significant and apply primarily to specific piece/parts. These differences are identified as required within this maintenance plan.

1.1 Power Unit Assembly Design Description

The power unit assembly consists of a fourteen-stage axial flow compressor section, a combustion section made up of six cylindrical through-flow combustion liners, a four-stage turbine section, and an accessory drive section.

1.1.1 Compressor Section Design Description

The compressor assembly is composed of an air inlet housing, a rotor assembly, a compressor case assembly, and a difusser assembly. The air inlet housing contains the compressor front bearing, compressor extension shaft, and the necessary gearing to drive the accessory drive section. A mounting pad is provided at the bottom for the accessory drive section and the power section breather is at the top. A labyrinth seal is used at the compressor front bearing, and a two-stage labyrinth seal is used at the front of the compressor rear bearing. The air inlet housing incorporates anti-icing valves and passages for directing compressor discharge anti-icing air to the strut leading edges, inlet vane assembly, fuel control pressure and temperature sensing

Narrative (continued)

probes, and torquemeter housing and anti-icing shroud. The compressor case assembly encloses the fourteen-wheel rotor assembly and supports the compressor stator vane assemblies.

The inner rings of the stator vane assemblies support the interstage air seals. Ports for bleeding off compressor air during start are provided in the compressor case. The diffuser assembly serves to diffuse the compressor discharge air and direct it into the combustion chamber. It supports the compressor rear bearing, compressor rear labyrinth seal, and six fuel nozzles. It incorporates external connections for the anti-icing air supply tubes, air supply line for closing the compressor air-bleed valves, oil sump vent line, scavenge oil line, oil sump, drain cover, lube oil line, scavenge oil pump (T56-A-14, -16, -423 and -425) and compressor rear labyrinth seal vent lines.

1.1.2 Combustion Section Design Description

The combustion section consists of six individual through-flow combustion liners evenly spaced in one annulus formed by an outer casing and inner casing. The combustion liners are located radially by the fuel nozzles at the front and by the turbine inlet vane assemblies at the rear. Six crossover tubes are located between the liners to transfer the flame from the two diametrically opposed liners which contain the spark igniters to the other four liners during engine starting. The fuel nozzles are mounted on the diffuser assembly and extend into the center of each liner dome. The combustion section outer casing encloses the combustion liners and serves as a supporting structure between the compressor and turbine sections. The outer casing is bolted to the compressor diffuser assembly at the front and to the turbine inlet casing at the rear. Six adapters for two spark igniters and four liner supports are provided at the forward end of the assembly. To prevent accumulation of unburned fuel in the combustion section, two burner drain valve assemblies are provided, one at the front end, and a second at the rear end of the outer casing.

The combustion section is not a separate assembled entity, but is generally treated as a part of the turbine section, to which it is physically attached.

1.1.3 Turbine Section Design Description

The turbine section consists of the turbine inlet casing and front bearing support, turbine rotor, turbine vane casing, turbine vane assemblies, and turbine rear bearing support.

Narrative (continued)

The combustion section inner casing and liner is also considered as part of the turbine section. The combustion section inner casing consists of an inner and outer shell which are separated by an air space. Both shells incorporate bellows type expansion joints to allow for expansion, contraction, and misalignment. The forward end of the outer shell is supported by a sleeve in the diffuser; the aft end is bolted to the turbine inlet casing. This arrangement allows for differential expansion between the combustion section inner and outer casings.

The front bearing support houses the turbine front bearing and combustion chamber inner casing liner. The turbine rotor assembly consists of four wheels supported by roller bearings at each end. Between adjacent turbine wheels is a turbine spacer disk. These disks are held in close proximity to the inner rings of the turbine vane assembly; they function as axial retainers for the blades and also as a labyrinth seal to minimize gas leakage between turbine stages. The turbine rotor is encased in the one-piece turbine casing assembly which consists of the vane assemblies. The casing assembly is bolted to the turbine inlet casing at the front and the turbine rear bearing support at the rear. The turbine rear bearing support houses the turbine rear bearing and provides a flange for mounting the turbine rear scavenge oil pump support and rear bearing labyrinth seal. In addition, the turbine rear bearing support assembly includes the outlet duct for the turbine rotor exhaust gases. The turbine front scavenge oil pump (T56-A-7A, -10WA and -426 only) is designed to scavenge the oil which gathers in the turbine front bearing area. The rear scavenge oil pump is located at the rear end of the rear turbine bearing support and scavenges oil which gathers in the rear turbine area.

The T56-A-14, -16, -423, and -425 do not have a turbine scavenge oil pump in front or a diffuser scavenge oil pump; these functions are handled by an external scavenge oil pump on the accessory drive.

Labyrinth type seals are incorporated at the front and rear turbine bearing locations on all engine models.

1.1.4 Accessory Drive Section Design Description

The accessory drive section is mounted on the bottom of the compressor air inlet housing. It provides the necessary gearing and mounting pads to drive the fuel pump, external scavenge oil pump (T56-A-14, -16, -423, and -425 only), fuel control, speed sensitive control, speed sensitive valve, main oil pressure and scavenge pump, and oil filter mounting pad.

Narrative (continued)

1.2 Reduction Gear Section Design Description

The reduction gear section includes a single propeller drive shaft, negative torque signal system, thrust sensitive signal system, propeller brake, a dry sump oil system, and gearing to provide the required speed reduction.

The main reduction gear train used to drive the propeller shaft consists of two stages of reduction -- a spur gear first stage and a planetary-type second stage. These two stages provide the necessary speed reduction from the engine speed to the speed required for the propeller.

The reduction gear section also contains an accessory drive gear train which drives the accessories mounted on the rear face of the reduction gear rear housing. These accessories are as follows:

a. Alternator
b. Hydraulic Pump or Engine Driven Compressor
c. Tachometer Generator
d. Oil Pump

Since the T56 engine is used in multi-engine aircraft, the accessories mounted on the reduction gear rear housing will not necessarily be the same in all aircraft engine positions. As previously mentioned, the T56-A-423 engine reduction gear section contains an additional active accessory pad and related gearing which is utilized to drive an alternator.

Front and rear scavenge pumps are driven by gears located on the propeller shaft and on the forward end of the pinion gear. The oil scavenged in the reduction gear assembly is directed through a return port near the bottom on the right side of the rear housing. Inserted in this opening is an indicating magnetic plug with a screen type filter. The threaded plug in the lower front housing (rear housing for T56-A-10WA and -14) is used to drain the residual oil from the reduction gear section.

Narrative (continued)

1.3 Torquemeter Section Design Description

The power unit assembly drives the reduction gear through an extension shaft and torquemeter section. The reduction gear section is secured to the power unit assembly by the torquemeter housing and a pair of tie struts which provide structural support.

The torquemeter section provides for measurement of the shaft power output of the power unit assembly and consists of the following principal components:

a. Concentric Shaft Assembly (Inner and Outer Torquemeter Shafts)
b. Torquemeter Housing
c. Torque Sensing Pickup
d. Safety Coupling
e. Cowl Assembly

The torquemeter measures torsional deflection that occurs in the power transmitting shaft. This torsional deflection is detected by magnetic pickups, measured electronically, and displayed on the aircraft instrument panel. A special type of shafting assembly consisting of two concentric shafts is used to create "windup" sufficient to produce the desired degree of accuracy. The inner, or torque shaft, carries the load that produces the measured "windup". The outer, or reference shaft, is rigidly connected to the torque shaft at the drive input end only and transfers the reference position to the output for measuring purposes. There are separate flanges on both the torque and reference shafts at the reduction gear assembly end. A sensing pickup assembly containing electromagnetic pickups mounted radially over the teeth of the torque and reference shaft flanges produce electrical impulses at the passage of each exciter tooth. As the torque shaft deflects when load is applied, the teeth on the torque flange are displaced with respect to the teeth on the reference flange, thus causing an increase in the phase displacement between impulses produced by the magnetic pickups mounted over these flanges.

A safety coupling is provided to disengage the reduction gear section from the power unit assembly in the event the power section is operating above a preset negative torque value of 6,000 inch pounds.

Narrative (continued)

1.4 Fuel/Control System Design Description

During flight the engine fuel/control system regulates engine speed by propeller constant speed governing and controls engine torque by the regulation of fuel control.

While taxiing, engine speed and torque are controlled by direct control of the propeller blade angle and regulation of fuel flow by the engine operator who maintains control of the engine through a power lever which is installed on the flight deck. A condition lever and a fuel cutoff handle, both installed on the flight deck, serve to feather the propeller and shut down the engine.

The principal components of the fuel system are as follows:

a. Fuel Pump
b. Low-pressure Filter Assemblies
c. High-pressure Fuel Filter Assembly
d. Fuel Control
e. Starting Fuel Enrichment System
f. Temperature Datum Valve
g. Fuel Manifold
h. Fuel Nozzles
i. Fuel Manifold Solenoid Drain Valve
j. Burner Drain Valves
k. Coordinator
l. Speed Sensitive Control

Fuel enters the engine-driven fuel pump and passes through the centrifugal boost pump which raises the pressure. From the outlet of the centrifugal boost pump the fuel is passed through the low-pressure filter. The filtered fuel is then returned to the inlet of the gear pump elements. During normal operation the pump elements operate in series. Fuel then passes through the high-pressure filter assembly to the fuel control. Parallel operation of the pump elements is provided for starting purposes through the incorporation of a paralleling valve in the filter assembly. The fuel control is essentially a scheduled control which functions to meter fuel as demanded by the control lever setting. From the fuel control the fuel passes through the temperature datum valve which bypasses the amount of fuel necessary to maintain a desired turbine inlet temperature

Narrative (continued)

in conjunction with a signal received from the electronic temperature datum control. Fuel leaving the temperature datum valve passes to the fuel manifold which distributes the fuel to the six fuel nozzles. Burner drain valves are incorporated on the bottom of the combustion section outer casing to prevent the accumulation of fuel in the combustion section after a false start or after shutdown.

The engine incorporates a starting fuel enrichment system which provides an increased fuel flow during an engine start. In addition to the normal flow through the fuel control, an enrichment bypass line allows pump discharge fuel to enter the system downstream of the metering portion of the fuel control. The fuel is then directed to the temperature datum valve, and to the fuel manifold and nozzles. A normally closed solenoid enrichment valve is located in the enrichment bypass line. It opens when the circuits are energized to allow pump discharge flow to parallel the flow from the fuel control.

The temperature datum valve is located between the fuel control and the fuel manifold. It acts in conjunction with the fuel control and responds to electrical signals from the electronic temperature datum control to provide a preselected schedule of turbine inlet temperature. The valve is motor-driven and receives its signal from the electronic temperature datum control which adjusts the position of the temperature datum valve to allow more or less fuel flow to the engine.

The fuel output from the temperature datum valve is connected to the fuel manifold. The manifold consists of y-fittings and flexible hoses which connects directly to the six fuel nozzles and to a manifold drain valve at the bottom of the engine. Each nozzle extends into the dome of a combustion liner. At pressures below 70 psi, fuel flows around a metering valve assembly and through the primary orifice to create a spray pattern at low fuel flow rates. At pressures above 70 psi, the metering valve opens and permits flow through both the secondary and primary orifices for normal operation.

A spring-loaded, solenoid-operated, drain valve is located at the bottom of the fuel manifold which drains the manifold when the pressure drops below eight to ten psi while the power unit is being stopped, thus minimizing the amount of fuel dripping into the combustion chambers at low pressures. During the starting cycle, the valve is closed by the speed sensitive control and is held closed by the subsequent build-up of fuel pressure within the manifold. Two combusion chamber drain valves are located in the bottom of the combustion chamber assembly (one at the forward end and the other at the aft end). The valves prevent the accumulation of fuel in the burner section after an unsuccessful start or after stopping the engine.

Narrative (continued)

The coordinator bolts to the rear face of the fuel control and coordinates the operation of the propeller, electronic temperature datum control, and fuel control. It receives signals through linkage from the flight deck power lever and the flight deck condition lever and transmits these signals to the fuel control and propeller regulator through a system of levers, and bellcranks.

1.5 Lubrication System Design Description

The power unit assembly of the T56-A-7A, -10WA, and -426 engines incorporates an independent dry sump oil system which includes one combination main pressure and scavenge oil pump assembly, and three separate scavenge pumps.

The power unit assembly of the T56-A-14, -16, -423, and -425 engines incorporates an independent dry sump oil system which includes a combination main pressure and scavenge oil pump assembly, a rear turbine scavenge pump and an external scavenge pump.

The main oil pump is located on the assessory drive section. Oil, supplied to the pump from the aircraft oil tank, is pumped through passages to a full-flow filter. This filter is also located on the accessory drive section and incorporates a check valve to keep oil from seeping into the power unit assembly after shutdown. A pressure regulating valve, located in the main oil pump, senses pressure at the filter outlet and limits the oil pressure delivered by the pump to 55 psi. A filter bypass valve is incorporated between the passages leading into and out of the filter and bypasses oil around the filter in the event the filter becomes clogged. A tube passes the oil to the diffuser assembly to provide compressor rear bearing lubrication. An internal line from the compressor rear bearing position goes through the inner combustion chamber casing assembly and carries oil to the turbine front bearing. The turbine rear bearing is lubricated by a continuation of the external tube from the diffuser to the turbine rear bearing support. The oil is returned from the compressor front bearing, extension shaft bearing, and extension shaft splines by gravity through drilled passages in the air inlet housing to the accessories housing where it is scavenged by the main scavenge pump.

Narrative (continued)

In the T56-A-7A, -10WA, and -426 engines lubricating oil in the compressor rear bearing drains to a sump in the diffuser assembly; the diffuser scavenge pump picks it up and returns the oil through tubes in the diffuser to an external line. The external line returns oil to the accessory drive section and then to the outlet side of the main scavenge pump.

Since the T56-A-14, -16, -423, and -425 engines do not have a diffuser scavenge pump, the oil from the diffuser sump is drawn out by the external scavenge oil pump and from there to the outlet side of the main scavenge pump. Lubricating oil is scavenged from the turbine front bearing by the turbine front scavenge oil pump and directed through a tube in the combustion section inner casing to the outlet side of the diffuser scavenge pump (T56-A-7A, -10WA, and -426 only). In the T56-A-14, -16, -423 and -425 the oil is drawn from the turbine front bearing sump by the external oil pump.

The oil flows through a tube in the combustion section inner casing to an outlet connector on the diffuser case and to the inlet of the external scavenge oil pump. Oil which lubricates the turbine rear bearing falls into the sump of the rear turbine scavenge oil pump support assembly and is directed by the scavenge oil pump through the turbine-to-compressor tie bolt. Drilled holes in the tie bolt provide lubrication for the front and rear turbine coupling shaft splines. Oil drains through splines in the turbine coupling shaft to either the turbine front bearing sump or the diffuser sump and is picked up by the turbine front scavenge oil pump in the T56-A-7A, -10WA and -426, or external scavenge oil pump in the T56A-14, -16, -423 and -425 and returned to the main scavenge oil pump outlet. A scavenge pressure relief valve located in the accessory drive relieves pressure in the event the scavenge outlet becomes restricted by congealed oil in the aircraft system. The power unit oil pressure pump maintains positive oil pressure at all engine speeds and operating altitudes.

The reduction gear section incorporates a dry sump oil system which consists of a gear type oil pump, filter, and two scavenge oil pumps. Both scavenge pumps are mounted internally, one at the bottom and one in the nose of the reudction gear assembly. Oil from the pressure pump passes through the filter assembly which includes a safety bypass valve that opens in the event the filter becomes clogged. From the filter the oil passes through a check valve and passages to a pinion oil nozzle, the propeller brake, the planetary gearing, the main bearings, and the propeller shaft bearings. The nose scavenge pump scavenges oil which collects in the front housing and delivers the oil to a common outlet connected with the main scavenge pump. The main pump scavenges the oil which collects in the bottom of the rear housing and them returns the oil through the common outlet to the aircraft oil supply tank. The reduction gear assembly oil pressure pump maintains positive oil pressure at all engine speeds and operating altitudes.

Narrative (continued)

The reduction gear oil system has a pressure adjusting valve in the oil pump body cover which allows the oil pressure to be increased, if necessary, to compensate for pump wear. The valve should not be used to decrease pressure as high pressure is usually caused by clogged oil passages which could cause oil starvation to vital components. The oil system also has a pressure relief valve that opens at approximately 280 psi to protect the magnesium alloy casting from rupture due to excessive oil pressure.

The engine breather mounted on top of the air inlet housing, vents the aircraft oil supply tank, the power unit assembly, and the reduction gear section.

1.6 Electrical System Design Description

The electrical system consists of an ignition system, thermocouples, thermocouple harness, power unit and reduction gear harnesses, and special purpose cables.

The following engine-furnished components are interconnected by the electrical system:

a. Anti-Icing Solenoid Valve
b. Fuel Manifold Pressure Switch
c. Fuel Enrichment Shutoff Valve
d. Fuel Manifold Drain Valve
e. Ignition Relay
f. Ignition Exciter
g. Speed Sensitive Control
h. High-Pressure Fuel Filter (Paralleling Valve and Pressure Switch)
i. Fuel Control
j. Temperature Datum Amplifier*
k. Temperature Datum Valve
l. Turbine Inlet Thermocouples
m. Coordinator Control
n. Torquemeter Sensing Pickup

Electrical power utilized by the electrical system and operation of the above components includes both 115 Vac 400 Hz and 28 Vdc. Variable voltages are used in some circuits.

* Aircraft mounted equipment

Narrative (continued)

The ignition system consists of an ignition relay, an ignition exciter, two high tension leads and spark igniters. When the ignition relay energizes during an engine start (approximately 16% or 2200 rpm) it completes the necessary electrical circuits to the ignition exciter, manifold drain valve, paralleling valve, and fuel enrichment valve. The ignition exciter raises the potential to provide the necessary ignition currents and voltages to arc the two spark igniters. The spark igniters are located near the front of Number 2 and Number 5 combustion liners.

The power unit electrical harnesses and cables connect engine mounted electrical components and terminate all wiring at three points for interfacing with aircraft connections. All engine models have a right hand and left hand electrical harness, and a right hand and left hand thermocouple harness.

Eighteen dual thermocouple assemblies are mounted in the turbine inlet casing to measure turbine inlet temperature. The output of the eighteen thermocouples are averaged and the resulting signal is transmitted to the temperature datum amplifier and furnishes turbine inlet temperature signals to the flight deck indicator.

The reduction gear wiring harness interconnects electrical components mounted on the reduction gear and propeller control components.

The temperature datum amplifier compensates for change in fuel density and characteristics, manufacturing tolerances in fuel controls, and variations in fuel requirements between engines. The amplifier is aircraft mounted and incorporates the electrical circuits necessary for operation of the temperature datum valve. The amplifier receives a turbine inlet temperature signal from the thermocouples in the turbine inlet casing and a desired temperature signal from the coordinator control which varies with power lever position according to a predetermined schedule. The temperature datum amplifier compares the actual and desired turbine inlet temperature signals. If the difference is greater than 4.5°F, an electrical signal is sent to the temperature datum valve which reduces or increases the fuel flow to the engine as necessary to bring the turbine inlet temperature back on schedule.

1.7 Bleed-Air System Design Description

The power unit assembly incorporates a bleed-air system which extracts air from the fifth- and tenth-stages of the compressor. The bleed-air system is utilized during the starting cycle to unload the compressor thereby reducing the possibility of "surge" or "stall" during engine start. Eight pneumatically operated air-bleed valves are located on the compressor case assembly. Four of these valves are mounted on the fifth-stage

Narrative (continued)

manifolds; the other four valves are mounted on the tenth-stage manifolds. The speed sensitive valve, mounted on the accessory drive section, controls the operation of the compressor air-bleed valves. Flex lines connect the speed sensitive valve to the diffuser and also interconnect the eight compressor air-bleed valves to the speed sensitive valve. The air, bled by the bleed valves, is collected by two manifolds which duct the bleed air aft and overboard.

During engine operation pressurized air entering the fifth or sixth-stage of the compressor is directed through internal engine passages to the compressor front labyrinth seal. This seal prevents oil from entering the compressor section.

Compressed and heated air is extracted from the diffuser (fourteenth-stage) for pressurization within the engine anti-icing. Heated air from the diffuser is provided to specific engine areas subject to the formation of ice. The extracted air is directed to the eight-radial struts of the air inlet housing, the compressor air inlet temperature probe anti-icer, the air inlet anti-icing vane assembly, and the lower half of the torquemeter housing shroud.

The anti-icing system consists of an anti-icing solenoid valve, two anti-icing air valve assemblies, attached tubing and flex lines, and the necessary electrical circuits for control.

1.8 Water/Alcohol Injection System Design Description

Water/alcohol injection is used on the T56-A-10WA engine only. The system provides a means of power recovery during takeoff on high ambient temperature days. On standard days additional power for short run takeoff is available. The system is composed of a storage tank, distribution system, injection nozzles, and controls. Injection fluid consists of a mixture of 2/3 distilled water by volume and 1/3 methyl alcohol by volume measured prior to mixing.

A common manifold fed by two pumps feeds all four engines from a storage tank. The system is preset to furnish a flow of 8 gallons per minute to each engine at 120 to 200 psi regulator inlet pressure. This allows 1.2 minutes of augmented takeoff power and empties the 38.5 U.S. gallon usable quantity storage tank. It is necessary to refill the storage tank after each water/alcohol injection augmented takeoff.

Narrative (continued)

A check valve in each pump discharge line prevents loss of water/alcohol injection fluid pressure by preventing back flow through a failed pump. The manifold feeds each engine through a flow regulator which controls injection fluid flow to its particular engine. From the regulator, the fluid flows through a hose to the engine torquemeter shroud inlet connection. From the engine inlet, the fluid flows through a line that runs between the torque shaft housing and its anti-icing duct to eight equally spaced nozzles located radially at the aft end of the torquemeter housing.

2.0 Maintenance Plan Summary

This maintenance plan identifies primary maintenance requirements as a function of the maintenance level for the basic T56 engine and for major components, assemblies, and sections comprising the engine. Additionally, the ground support equipment facilitating these maintenance requirements is also identified as are all repairable components and assemblies. The maintenance plan does not include engine related assemblies which are not an integral part of the engine unless identified by the engine WUC; i.e., the temperature datum amplifier and sequence relay.

Specific maintenance requirements associated with tubing, hoses, wires, cables, brackets, fasteners and miscellaneous hardware are not identified in this maintenance plan. These parts are maintained by hand reworking at the applicable maintenance level from pre-expended stock.

Maintenance on the T56 engine is divided into two categories, scheduled and corrective, and is conducted at three levels ranging from the organizational level, through the intermediate level (which is comprised of three separate degrees of capability), to the depot level. Each maintenance level (and each degree within the intermediate level) is responsible for performing the maintenance normally authorized as well as that which is authorized for lower levels.

Maintenance at all maintenance levels is basically the same for each of the T56 engine configurations; however, differences exist between ground support equipment since four different series of aircraft are involved. Maintenance on the T56-A-425 and -426 engines is limited during carrier deployment. On-aircraft replacement of accessories and components comprising the fuel/control, lubrication, electrical, and bleed-air systems can be accomplished. However, engine "spares" support is in the form of complete QEC kits. Once a QEC is removed from the aircraft, additional maintenance in the form of section troubleshooting or replacement is not performed and the faulty engine is returned to a land-based repair facility.

T56 Turboprop Engine

Nomenclature/Designation

Revision Number

Narrative (continued)

2.1 Organizational (0) Level

2.1.1 Scheduled Maintenance

Scheduled maintenance at the organizational level includes engine washing, cleaning (walnut shell injection), inspections (for physical damage or deterioration, fuel or oil leakage, and attaching hardware security), operational and functional checks, and removal/replacement of the complete engine or turbine change assembly to accommodate overhaul of time limited items. Time limited items are as follows:

Power Unit Assembly -
Conditional

Compressor Rotor Assembly -
Conditional

Turbine Rotor Assembly -
High time 2400 hours/conditional[1]
High time 1600 hours/conditional[2]

Turbine 1st Stage Rotor Wheel -
High time 7500 hours/conditional[3]

Reduction Gear Section -
Conditional

Torquemeter Section -
High time 5000 hours/conditional[4]

Accessory Drive Section -
Conditional

Fuel Pump -
Conditional

1. T56-A-7A & -10WA w/o PPC-44 is time limited; with PPC-44 overhaul is conditional.
2. T56-A-426 w/o PPC-44 is time limited; with PPC-44 overhaul is conditional.
3. T56-A-14, -16, -423, & -425 Series III turbine P/N 6846932 is time limited; superseded by P/N 6875431 which has conditional overhaul -- all other 1st stage rotor wheels have conditional overhaul.
4. All T56 engines w/o PPC-4A have time limited torquemeter sections; with PP-4A overhaul is conditional.

Conditional

Speed Sensitive Control -
Conditional

Ignition Exciter -
Conditional

Speed Sensitive Valve -
Conditional

Specific scheduled maintenance requirements are individually listed in Part III.

2.1.2 Corrective Maintenance

The performance of corrective maintenance at the organizationa level includes the following activities:

a. Engine operational checks and on-aircraft troubleshooting using aircraft instrumentation and applicable test equipment.
b. Adjustment of fuel/control system components and oil pressure regulating valves.

T56 Turboprop Engine

Nomenclature/Designation

Revision Number

Narrative (continued)

c. Servicing of fuel, lubrication, and bleed-air systems (i.e., cleaning/replacing filters and screens).
d. Complete engine replacement.
e. Over-the-wing turbine change assembly replacement (T56-A-10WA, &-14)/under-the-wing turbine change assembly replacement (T56-A-7A, -16, & -423).
f. Replacement of accessories and components comprising the fuel/control, lubrication, electrical and bleed-air systems with the exception of the diffuser scavenge pump, turbine front scavenge pump and two reduction gear scavenge pumps.
g. Replacement of combustion section burner drain valve.
h. Replacement of turbine rear bearing support, support cone, and inner rear exhaust cone.
i. Replacement of torquemeter cowl assembly, cowl cover, cowl dome, cowl duct, and water/alcohol injection manifolds/nozzles.

2.2 Third Degree Intermediate (I3) Level

2.2.1 Scheduled Maintenance

Inspect spark igniters, combustion liner supports, ignition harness, and spark igniter leads in accordance with Part III whenever an engine is removed and its operating time since new/overhaul is $\geq$ 500 hours.

2.2.2 Corrective Maintenance

Corrective maintenance at the third degree intermediate level includes restoration of a faulty engine to a serviceable status by testing and troubleshooting to isolate the fault to a defective removable accessory or component, or to a replaceable section.

I3 level maintenance includes partial dismantling of the engine into its constituent sections. The turbine section (including the combustion liner assembly), the reduction gear section, and the torquemeter section may be removed and replaced. The accessory drive section and compressor section can be separated from the turbine section as an integral assembly, but the accessory drive cannot be removed at the I3 level. I3 level maintenance of the accessory drive is limited to removal of the attaching accessories and components, and inspection of shaft splines.

In addition to accessories and components replaceable at the O level, the I3 level can remove/replace the compressor 5th and 10th stage bleed manifolds and diffuser scavenge pump.

Narrative (continued)

I3 maintenance activities also include: compressor blade/vane inspection; borescope inspection of the turbine 1st stage blades and vanes, and combustion liners; and turbine rotor axial clearance check.

I3 level maintenance does not have engine test stands and must, therefore, use an aircraft for run-up.

Defects which are identified by require further disassembly of the faulty engine sections to facilitate repair cannot be accomplished at the I3 maintenance level. Restoration of the engine to a serviceable condition must be accomplished by complete section replacement and the defective or faulty section forwarded to a higher maintenance level where disassembly can be accomplished. For example, the I3 maintenance level can remove and install a turbine section; however, they cannot build-up a turbine section.

2.3 Second Degree Intermediate (I2) Level

2.3.1 Scheduled Maintenance

See I3 scheduled maintenance.

2.3.2 Corrective Maintenance

Corrective maintenance at the second degree intermediate level permits complete engine dismantling (separation of the accessory drive section and compressor section, and removal of the combustion liner assembly from the turbine section), and limited disassembly of engine sections as discussed below.

Removal of the turbine front scavenge pump, which requires the combustion liner assembly to be removed to gain access, is permitted at the I2 level.

In addition to the repairs authorized at the lower maintenance level, the following maintenance activities can be accomplished on engine sections at the I2 level involving section disassembly.

T56 Turboprop Engine

Nomenclature/Designation

Revision Number

Narrative (continued)

Compressor Section:

Removal and replacement of the following items -

a. Extension shaft, housing, and side gear
b. Air inlet housing and inlet vane
c. Front bearing and labyrinth seal
d. Diffuser assembly
e. Rear bearing and seal

The compressor case assembly can be removed and reinstalled (same case assembly only), and minor repairs can be performed to parts exhibiting nicks, scratches, or abrasions by light polishing.

Turbine Section:

Removal and replacement of the following items -

a. Combustion chamber outer casing
b. Combustion liners
c. Inner casing and inner casing liner
d. Turbine rear bearing, support and seal
e. Turbine front bearing, support, cage and seals
f. Turbine inlet casing
g. Turbine stator vanes and vane casing
h. Turbine front bearing inner ring and labyrinth seal
i. Turbine rotor
j. Inner front exhaust cone
k. Turbine coupling shaft

Narrative (continued)

Minor repairs can be performed to parts exhibiting nicks, dents, scratches, and abrasions. No repair of turbine blades or vanes can be accomplished because of the ALPAK coating. Combustion liner repair includes inert gas arc welding.

Accessory Drive Section:

Section removal and replacement, and repair by replacement of shaft gears, spin gears, idler and drive gears, and associated bearings, gaskets and seals.

Torquemeter Section

Section removal and replacement, and replacement of anti-ice shroud, pick-ups, safety coupling/torque shaft and mid-bearings.

Reduction Gear Section:

Section removal and replacement. Total repair of rear housing diaphragm assembly of reduction gear section including replacement of the propeller brake and starter gear; bearing inner diaphragm; drain plug inserts; tachometer drive shafts and bearings; alternator gears, shaft and bearings; hydraulic pump/engine driven compressor gears and bearings; pinion shaft gear assembly; main drive gear assembly and bearings; sun gear assembly; and rear scavenge pump. No repairs are permited internally to the front housing.

2.4 First Degree Intermediate (I1) Level

2.4.1 Scheduled Maintenance

See I3 scheduled maintenance

2.4.2 Corrective Maintenance

Corrective maintenance at the I1 level consists of all maintenance activities necessary to facilitate complete engine repair by removal/replacement or repair/rework of all engine sections and/or components. In addition to all maintenance activities performed at lower levels, and I1 level provides the capability

Narrative (continued)

of removing and replacing the compressor rotor. Additionally, a limited rework capability is provided for the compressor rotor blades and stator vanes. Rework is limited to cleaning, grinding, and polishing.

2.5 Depot Level

2.5.1 Scheduled Maintenance

Scheduled maintenance at the depot level consists of overhaul (zero timing) of time limited items. Time limited items are as follows:

Power Unit Assembly -
Conditional

Compressor Rotor Assembly -
Conditional

Turbine Rotor Assembly -
High time 2400 hours/conditional[1]
High time 1600 hours/conditional[2]

Turbine 1st Stage Rotor Wheel -
High time 7500 hours/conditional[3]

Reduction Gear Section -
Conditional

Torquemeter Section -
High time 5000 hours/conditional[4]

Accessory Drive Section -
Conditional

1. T56-A-7A & -10WA w/o PPC-44 is time limited; with PPC-44 overhaul is conditional.
2. T56-A-426 w/o PPC-44 is time limited; with PPC-44 overhaul is conditional.
3. T56-A-14, -16, -423 & -425 Series III turbine P/N 6846932 is time limited; superceded by P/N 6875431 which has conditional overhaul -- all other 1st stage rotor wheels have conditional overhaul.
4. All T56 engines w/o PPC-4A have time limited torquemeter sections; with PP-4A overhaul is conditional.

Narrative (continued)

Speed Sensitive Control -
Conditional

Ignition Exciter -
Conditional

Speed Sensitive Valve -
Conditional

2.5.2 Corrective Maintenance

Corrective maintenance at the depot level includes a complete engine repair capability and an overhaul (zero timing) capability.

Narrative (continued)

Depot complete engine repair activities are basically the same as those at the Il level with the exception that the depot has increased facilities; hence, increased rework capabilities.

In addition to the capabilities of lower maintenance levels, depot capabilities which support both complete engine repair and overhaul include the following:

a. Performance of magnetic and fluorescent penetrant inspections of metal parts as required.
b. Rework of case assemblies, combustion liners, rotor blades/wheels/spacers, stator vanes, by blending, plating, welding, cold reforming, machining, grinding, and polishing.
c. Rework of gears, shafts, splines, and bearings/supports/journals, by plating, welding, metallizing, grinding, and polishing.
d. Dynamic balancing of compressor and turbine rotors, torquemeter shaft, safety coupling, and turbine coupling shaft.

Also complete disassembly, inspection, disposition, repair, replacement, test, and overhaul is performed on accessories, components, and sections returned from the fleet resulting in zero-timing of these items.

3.0 Plan Rationale

The maintenance plan for the T56 turboprop engine is based on the provisions of the Naval Aviation Maintenance Maintenance Program OPNAVINST 4790.2A, and the Gas Turbine Engine Three Degree Intermediate Level Mainenance Program, NAVAIRINST 13700.6A.

Although the maintenance requirements for the T56 are within the capability of most intermediate facilities, the cost and complexity of required special GSE does not justify complete engine repair (CER) at all the intermediate maintenance facilities. Maintenance requirements are allocated to specific maintenance levels and/or degrees in accordance with current GSE resources.

Aircraft and GSE usage data are not provided in Part II. Current fleet usage data applies and can be obtained through the Navy supply system.

MAINTENANCE PLAN
PART III – MAINTENANCE REQUIREMENTS

Nomenclature/Designation	WUC/LSACN	Preparing Activity	No.
T56 Turboprop Engine	22300	Naval Air Systems Command	PPMP0002
Part Number	**NSN**	**Prepared by** AIR-4113/ARINC Research Corp.	
FSCM Code 73342	**Application** P-3, E-2, C-2 and C-130 series aircraft	**Date of Initial Submission**	**Revision Number** / **Date of Revision**

Req. Number	Requirement	Maintenance Level	Interval	GSE Requirement
	SCHEDULED MAINTENANCE The scheduled maintenance requirements contained in this maintenance plan represent the minimum engine requirements and maximum intervals determined by NARF Alameda as a result of the T56 Engine Analytical Maintenance Program (AMP). Additional scheduled maintenance may be implemented and maintenance requirements may be performed at more frequent intervals at the discretion of the aircraft CFA. Organizational Level			
001S	Perform QEC zonal examination (internal).	0	Phased 1200 hrs.	Maintenance platform and common hand tools
002S	Conduct engine performance trend analysis (T56-A-10WA, & -14).	0	Special 28 Days	See Table 2, Group 1

Approved By (Navy)	Title	Date	Page
G. C. Doubleday III	Leader, Propulsion Maintenance Engineering	6 January 1978	45 of 130

Req. Number	Requirement	Maintenance Level	Interval	GSE Requirement
003S	Conduct engine performance trend analysis (T56-A-425, & -426).	0	Phased 100 hrs. ashore 200 hrs. afloat	See Table 2, Group 1
004S	Conduct engine performance trend analysis (T56-A-7A, -16, & -423).	0	Phased 150/200 hrs	See Table 2, Group 1
005S	Inspect compressor air inlet housing for FOD, cracks, corrosion, and salt deposits (T56-A-10WA, -14, -425, & -426).	0	Special 56 days	Maintenance platform and common hand tools
006S	Inspect compressor air inlet housing for FOD cracks, corrosion, and salt deposits (T56-A-7A, -16, & -423).	0	Phased 300 hrs.	Maintenance platform and common hand tools
007S	Inspect compressor blades and vanes for evidence of oil leakage from #1 bearing area (T56-A-10WA, -14, -425, & 426).	0	Special 56 days	Maintenance platform and common hand tools
008S	Inspect compressor blades and vanes for evidence of oil leakage from #1 bearing area (T56-A-7A, -16 & -423).	0	Phased 300 hrs.	Maintenance platform and common hand tools
009S	Inspect compressor air inlet guide vanes, stator vanes and rotor blades for FOD cracks corrosion and salt deposits (T56-A-10WA, -14, 425, & -426).	0	Special 56 days	Maintenance platform and common hand tools
010S	Inspect compressor air inlet guide vanes, stator vanes and rotor blades for FOD cracks corrosion and salt deposits (T56-A-7A, -16, & -423).	0	Phased 300 hrs.	Maintenance platform and common hand tools
011S	Inspect compressor air inlet guide vanes, stator vanes, and rotor blades for FOD.	0	Phased 400/600 hrs.	Maintenance platform and common hand tools

T56 Turboprop Engine
Nomenclature/Designation

Revision Number

Req. Number	Requirement	Maintenance Level	Interval	GSE Requirement
012S	Inspect compressor case assembly for corrosion (T56-A-10WA, -14, -425, & -426).	0	Special 84 days	Maintenance platform and common hand tools
013S	Inspect compressor case assembly for corrosion (T56-A-10WA, -14, -425, & -426).	0	Phased 150 hrs.	Maintenance platform and common hand tools
014S	Inspect spark igniters for excessive carbon deposits; center electrodes for looseness and specified length. Check combustion liner supports for cracks (especially in the flange-to-shell brack area). Inspect ignition harness and spark igniter leads for cleanliness, evidence of burning, breaks, fraying, chafing, isulation deterioration and looseness (T56-A-7A, -10WA-14, -16, & -423).	0	Phased 600 hrs.	Maintenance platform and common hand tools
015S	Inspect turbine rear bearing support struts for cracks and distortion (T56-A-10WA, & -14).	0	Phased 600 hrs.	Maintenance platform and common hand tools
016S	Inspect turbine rear bearing support struts for cracks and distortion (T56-A-7A, -16, -423, -425, & -426).	0	Phased 400/600 hrs.	Maintenance platform and common hand tools
017S	Inspect turbine exhaust cone for distortion, buckling, cracks, and security (T56-A-10WA, & -14).	0	Phased 600 hrs.	Maintenance platform and common hand tools
018S	Inspect turbine exhaust cone for distortion, buckling, cracks, and security (T56-A-7A, -16, -423, -425, & -426).	0	Phased 400/600 hrs.	Maintenance platform and common hand tools
019S	Inspect turbine section for cracks, tears, burn damage, looseness, and oil leakage (T56-A-10WA, & -14).	0	Phased 600 hrs.	Maintenance platform and common hand tools

T56 Turboprop Engine
Nomenclature/Designation

Revision Number

Req. Number	Requirement	Maintenance Level	Interval	GSE Requirement
020S	Inspect turbine section for cracks, tears, burn damage, looseness, and oil leakage (T56-A-7A, -16, -423, -425, & -426).	0	Phased 400/600 hrs.	Maintenance platform and common hand tools
021S	Perform borescope inspection of 1st stage turbine blades and vanes for cracks, breaks, warpage, sulfidation melting, and erosion through thermocouple holes.	0	Phased 600 hrs.	Maintenance platform, borescope and common hand tools
022S	Inspect 4th stage turbine blades and vanes for cracks, warpage, nicks, and blade tips for clearance and evidence of rubbing from aft end with tailpipe removed (T56-A-10WA, & -14).	0	Phased 600 hrs.	Maintenance platform and common hand tools
023S	Inspect 4th stage turbine blades and vanes for cracks, warpage, nicks, and blade tips for clearance and evidence of rubbind from aft end with tailpipe removed (T56-A-7A, -16, -423, -425, & -426).	0	Phased 400/600 hrs.	Maintenance platform and common hand tools
024S	Inspect reduction gear section oil filter for damage and contamination.	0	Phased 600 hrs.	Maintenance platform and common hand tools
025S	Inspect reduction gear section scavenge pump screen for damage and contamination (T56-A-10WA-14, -425, & -426).	0	Phased 1200 hrs.	Maintenance platform and common hand tools
026S	Inspect reduction gear section scavenge pump screen for damage and contamination (T56-A-7A, -16, & -423).	0	Phased 600 hrs.	Maintenance platform and common hand tools
027S	Perform contamination check of reduction gear section magnetic plug (T56-A-10WA, -14, -425, & -426).	0	Phased 1200 hrs.	Maintenance platform and common hand tools
028S	Perform continuity check of reduction gear section magnetic plug (T56-A-7A, -16, & -423).	0	Phased 150 hrs.	Maintenance platform and common hand tools

T56 Turboprop Engine
Nomenclature/Designation

Revision Number

Req. Number	Requirement	Maintenance Level	Interval	GSE Requirement
029S	Inspect reduction gear section starter splines and cavity for wear and corrosion (T56-A-7A, -16, & -423).	O	Phased 1000 hrs.	Maintenance platform and common hand tools
030S	Inspect reduction gear section starter splines and cavity for wear and corrosion (T56-A-425, & -426).	O	Phased 600 hrs.	Maintenance platform and common hand tools
031S	Inspect reduction gear section generator splines and cavity for wear and corrosion (T56-A-425, & -426).	O	Phased 1000 hrs.	Maintenance platform and common hand tools
032S	Inspect reduction gear section generator and starter splines and cavities for wear and corrosion (T56-A-10WA, & -14).	O	Phased 600 hrs.	Maintenance platform and common hand tools
033S	Perform contamination check of accessory drive section magnetic plug (T56-A-10WA, -14, -425, & -426).	O	Phased 1200 hrs.	Maintenance platform and common hand tools
034S	Perform continuity check of accessory drive section magnetic plug (T56-A-7A, -16, & -423).	O	Phased 150 hrs.	Maintenance platform and common hand tools
035S	Inspect nacelle area for fuel/oil leakage (external).	O	Daily	Common hand tools
036S	Inspect fuel/oil components for fuel/oil leakage (internal).	O	Phased 600 hrs.	Maintenance platform and common hand tools
037S	Inspect fuel control air sensing tip (CIT probe) for obstructions (T56-A-10WA, -14, -425, & -426).	O	Special 56 days	Maintenance platform and common hand tools
038S	Inspect fuel control air sensing tip (CIT probe) for obstructions (T56-A-7A, -16, & -423).	O	Phased 300 hrs.	Maintenance platform and common hand tools
039S	Inspect differential indicator on low pressure fuel filter for contamination and bypass condition (T56-A-425, & -426).	O	Daily Phased 300 hrs.	Common hand tools

Req. Number	Requirement	Maintenance Level	Interval	GSE Requirement
040S	Inspect low pressure fuel filter case for contamination and filter element for contamination and paper disintegration.	O	Phased 1200 hrs.	Maintenance platform and common hand tools
041S	Inspect high pressure fuel filter for contamination and and damage.	O	Phased 1200 hrs.	Maintenance platform and common hand tools
042S	Inspect main engine oil pressure/scavenge pump filter for contamination and damage.	O	Phased 600 hrs.	Maintenance platform and common hand tools
043S	Remove each center thermocouple from all combustion liners if accessible (otherwise the most accessible thermocouple) and inspect for deformation and burned tips. Where non-air cooled thermocouples are used check for probe inlet hole elonguation. Inspect adjacent thermocouples (through center thermocouple hole using borescope) for deformation and burned tips. Check thermocouples for broken ceramic loose terminals, nuts, and lugs. Check resistance of all removed thermocouples (T56-A-10WA, & -14).	O	Phased 600 hrs.	Maintenance platform, borescope, thermocouple warpage measuring fixture, thermocouple tester and common hand tools
044S	Remove each center thermocouple from all combustion liners if accessible (otherwise the most accessible thermocouple) and inspect for deformation and burned tips. Where non-air cooled thermocouples are used check for probe inlet hole elonguation. Inspect adjacent thermocouples (through center thermocouple hole using borescope) for deformation and burned tips. Check thermocouples for broken ceramic loose terminals, nuts, and lugs. Check resistance of all removed thermocouples (T56-A-7A, -16, -423, -425, & -426).	O	Phased 300/400	Maintenance platform, borescope, thermocouple warpage measuring fixture, thermocouple tester and common hand tools

T56 Turboprop Engine
Nomenclature/Designation

Revision Number

Req. Number	Requirement	Maintenance Level	Interval	GSE Requirement
045S	Perform resistance check on terminal block studs in accordance with appropriate maintenance instructions manual. Check thermocouple harness for evidence of red residue (powder) at thermocouple lead connections. Inspect thermocouple harness and cable leads for burning, chafing, or cracking of conduit.	0	Phased 600 hrs.	Maintenance platform, multimeter, and common hand tools
046S	Check ignition exciter for security and lockwire.	0	Phased 1200 hrs.	Maintenance platform and common hand tools
047S	Inspect compressor air-bleed valve filter for contamination and damage (T56-A-7A, -425, & -426).	0	Phased 600 hrs.	Maintenance platform and common hand tools
048S	Inspect visible bleed-air/de-ice lines and components for leakage (T56-A-7A, -16, -423, -425, & -426).	0	Phased 300 hrs.	Maintenance platform and common hand tools
049S	Inspect visible bleed-air/de-ice lines and components for leakage (T56-A-10WA, & -14).	0	Phased 1200 hrs.	Maintenance platform and common hand tools
050S	Perform compressor washing procedure (T56-A-10WA, & -14).*	0	Special 28 days	Trailer mounted engine wash cart
051S	Perform compressor washing procedure (T56-A-425, & -426).*	0	Special 56 days	Trailer mounted engine wash cart
052S	Perform engine cleaning procedure (walnut shell injection).**	0	Conditional	See Table 2, Group 5
053S	Drain and refill engine lubricating oil supply.	0	Phased 1200 hrs.	Common hand tools

* Do not perform compressor cleaning procedure if temperature is less than 40°F.
** The frequency of walnut shell injection utilization should be held to a minimum.

Req. Number	Requirement	Maintenance Level	Interval	GSE Requirement
	Intermediate Level			
054S	Inspect spark igniters for excessive carbon deposits; center electrodes for looseness and specified length. Check combustion liner supports for cracks (especially in the flange-to-shell brace area). Inspect ignition harness and spark igniter leads for cleanliness, evidence of burning, breaks, fraying, chafing, insulation deterioration and looseness (T56-A-425, & -426).	I	Whenever engine is removed & time since new/overhaul is ≥ 500 hrs.	Common hand tools
	Depot Level			
055S	Power unit assembly overhaul	D	Conditional	See Table 5, Groups 1 thru 17
056S	Compressor rotor overhaul	D	Conditional	See Table 5, Group 6
057S	Turbine rotor overhaul (T56-A-7A, & -10WA, w/o PPC-44)	D	HT 2400 hrs.	See Table 5, Group 16
058S	Turbine rotor overhaul (T56-A-426, w/o PPC-44)	D	HT 1600 hrs.	See Table 5, Group 16
059S	Turbine rotor overhaul (with PPC-44)	D	Conditional	See Table 5, Group 16
060S	Discard 1st stage turbine wheel P/N 6846932 and install P/N 6875431 if available.	D	HT 7500 hrs.	See Table 5, Group 16
061S	All other 1st stage turbine wheels	D	Conditional	See Table 5, Group 16
062S	Reduction gear section overhaul	D	Conditional	See Table 5, Groups 22 thru 26

MAINTENANCE PLAN

PART III – MAINTENANCE REQUIREMENTS (continued)

T56 Turboprop Engine
Nomenclature/Designation

Revision Number

Req. Number	Requirement	Maintenance Level	Interval	GSE Requirement
063S	Torquemeter section overhaul (w/o PPC-4A)	D	5000 hrs.	See Table 5, Groups 19 thru 21
064S	Torquemeter section overhaul (w PPC-4A)	D	Conditional	See Table 5, Groups 19 thru 21
065S	Accessory drive section overhaul	D	Conditional	See Table 5, Group 18
066S	Fuel pump overhaul	D	Conditional	See Table 4, Group 21
067S	Fuel control overhaul	D	Conditional	See Table 4, Groups 19 and 20
068S	Temperature datum valve overhaul	D	Conditional	Common hand tools
069S	Fuel nozzle overhaul	D	Conditional	See Table 4, Group 7
070S	Coordinator control overhaul	D	Conditional	See Table 4, Group 3
071S	Main engine oil pressure/scavenage pump overhaul	D	Conditional	See Table 4, Group 10
072S	Speed sensitive control control erhaul	D	Conditional	Common hand tools
073S	Ignition exciter overhaul	D	Conditional	Common hand tools
074S	Speed sensitive valve overhaul	D	Conditional	See Table 4, Group 16

T56 Turboprop Engine
Nomenclature/Designation

Revision Number

Req. Number	Requirement	Maintenance Level	Interval	GSE Requirement
	CORRECTIVE MAINTENANCE			
	Organizational Level			
001C	Fault isolate to associated engine section, system, and/or component conducting an operational checkout and following documented troubleshooting procedures	O	N/A	See Table 2, Group 1 as required, and use aircraft instrumentation and common hand tools
002C	Based on the results of the operational checkout and troubleshooting procedure repair the T56 engine in the aircraft by:	O	N/A	See Table 2, Group 1 as required, and use aircraft instrumentation and common hand tools
	1. Adjust as required.			
	a. Coordinator potentiometer and switch	O	N/A	
	b. Coordinator/fuel control linkage	O	N/A	
	c. Fuel control governor	O	N/A	
	d. Low speed ground idle	O	N/A	
	e. Desensitized minimum-flow stop fuel control	O	N/A	
	f. Temperature datum control system	O	N/A	
	g. Power unit assembly pressure regulating valve (main oil pump)	O	N/A	
	h. Reduction gear section pressure regulating valve (to increase pressure only)	O	N/A	
	2. Remove, clean and/or replace the following components (listed by section/system in which located) as required.			
	(Combustion Section)			
	a. Burner drain valve	O	N/A	See Table 4, Group 2

Req. Number	Requirement	Maintenance Level	Interval	GSE Requirement
	(Fuel/Control System)			
	b. Coordinator control	O	N/A	Multimeter
	c. Fuel control	O	N/A	See Table 4, Group 19
	d. Fuel control cutoff actuator	O	N/A	See Table 4, Group 23
	e. Fuel enrichment pressure switch	O	N/A	
	f. Fuel enrichment shutoff valve[1]*	O	N/A	
	g. Low pressure filter differential indicator	O	N/A	
	h. Fuel filter, high pressure	O	N/A	Ultrasonic cleaner
	i. Fuel filter, low pressure	O	N/A	See Table 4, Groups 5 and 19
	j. Fuel filter high pressure switch	O	N/A	
	k. Fuel hose assemblies[2]	O	N/A	
	l. Fuel manifold drain valve	O	N/A	
	m. Fuel spray nozzle assembly	O	N/A	
	n. Fuel pump	O	N/A	See Table 4, Group 1
	o. Fuel reducer check valve[3]	O	N/A	
	p. Paralleling valve	O	N/A	
	q. Speed sensitive control	O	N/A	
	r. Temperature datum valve	O	N/A	See Table 4, Group 19
	s. Three-way elbow valve	O	N/A	
	(Lubrication System)			
	t. External oil scavenge pump[4,5]	O	N/A	
	u. Main engine oil pressure/scavenge pump	O	N/A	
	v. Oil pressure regulating valve[1]	O	N/A	
	w. Power unit oil filter[2]	O	N/A	Ultrasonic cleaner
	x. Reduction gear external pressure relief valve	O	N/A	
	y. Reduction gear lube pump/filter	O	N/A	
	z. Turbine scavenge pump, rear	O	N/A	See Table 4, Group 13

*All numbered footnotes appear on page 130.

Req. Number	Requirement	Maintenance Level	Interval	GSE Requirement
	(Electrical System)			
	aa. Box assembly, distribution[2]	O	N/A	
	ab. Box assembly, sequence relay[6]	O	N/A	
	ac. Feather solenoid[5,7]	O	N/A	
	ad. Ignition exciter[5]	O	N/A	
	ae. Ignition relay[2]	O	N/A	
	af. Negative torque signal actuator	O	N/A	
	ag. Power unit magnetic plug[2]	O	N/A	
	ah. Power unit thermocouple cables[2]	O	N/A	
	ai. Power unit special cable assemblies	O	N/A	
	aj. Power unit wiring harness assemblies	O	N/A	
	ak. Reduction gear wiring harness[2]	O	N/A	
	al. Reduction gear magnetic plug[2]	O	N/A	
	am. Spark igniter plugs[2]	O	N/A	
	an. Spark igniter leads	O	N/A	
	ao. Temperature datum amplifier[6]	O	N/A	
	ap. Thermocouples[2]	O	N/A	See Table 4, Group 24
	aq. Thrust sensitive actuator[3]	O	N/A	
	ar. Thrust sensitive switch[3]	O	N/A	
	as. Torquemeter sensing pickup[2]	O	N/A	
	(Bleed-Air Systems)			
	at. Air bleed valve	O	N/A	See Table 4, Group 23
	au. Anti-ice air hose assemblies[2]	O	N/A	
	av. Anti-ice air valve[1]	O	N/A	
	aw. Anti-ice solenoid valve[5]	O	N/A	
	ax. Compressor air bleed filter[1]	O	N/A	
	ay. Speed sensitive valve	O	N/A	See Table 4, Groups 1 and 19

T56 Turboprop Engine
Nomenclature/Designation

Revision Number

Req. Number	Requirement	Maintenance Level	Interval	GSE Requirement
	(Water/Alchol System) [8]			
	az. Water/alchol injection manifold [8]	O	N/A	
	ba. Water/alchol injection nozzles [8]	O	N/A	
	3. Perform over-the-wing removal/installation of turbine change assembly in accordance with appropriate removal/installation procedures (T56-A-10WA, and -14 engines). Send removed turbine change assembly section to supply for disposition.	O	N/A	See Table 2, Group 2, and use common hand tools
	4. Perform under-the-wing removal/installation of turbine change assembly in accordance with appropriate removal/installation procedures (T56-A-7A, -16, and -423 engines). Send removed turbine change assembly to supply for disposition.	O	N/A	See Table 2, Group 3, and use common hand tools
003C	Verify engine corrective action by operational test and check out.	O	N/A	See Table 2, Group 1
004C	If the engine cannot be repaired on the aircraft by adjustment, cleaning or replacing components, or replacing sections as called out in req. #002C, remove/replace the faulty engine (QEC) in accordance with appropriate engine removal/installation procedure and send the faulty engine to supply for disposition.	O	N/A	See Table 2, Group 4, and use common hand tools

	ak. Temperature datum amplifier[6]	I3	N/A	
	al. Thermocouples [2]	I3	N/A	
	am. Air bleed valve	I3	N/A	See Table 4, Group 23
	an. Anti-ice air hose assemblies [2]	I3	N/A	
	ao. Anti-ice air valve[1]	I3	N/A	
	ap. Anti-ice solenoid valve [5]	I3	N/A	
	aq. Compressor air bleed filter [1]	I3	N/A	
	ar. Speed sensitive valve	I3	N/A	
	(Reduction Gear Section)			
	as. Reduction gear housing plugs[2]	I3	N/A	
	at. Reduction gear external pressure relief valve[1]	I3	N/A	See Table 3, Group 37
	au. Reduction gear lube pump/filter	I3	N/A	See Table 3, Group 43
	av. Reduction gear magnetic plug[2]	I3	N/A	
	aw. Reduction gear magnetic plug housing[2]	I3	N/A	
	ax. Reduction gear wiring harness[2]	I3	N/A	
	ay. Rear housing oil seals [2]	I3	N/A	

Req. Number	Requirement	Maintenance Level	Interval	GSE Requirement
	az. Feather solenoid[5,7]	I3	N/A	
	ba. Thrust sensitive switch[1,3]	I3	N/A	
	bb. Thrust sensitive actuator[1,3]	I3	N/A	Spring compressor 6796828
	bc. Scavenge oil screen	I3	N/A	
	(Torquemeter Section)			
	bd. Torquemeter sensing pickup[2]	I3	N/A	See Table 3, Group 52
	be. Water/alcohol injection manifold[8]	I3	N/A	
	bf. Water/alcohol injection nozzles[8]	I3	N/A	Ultrasonic cleaner
	Engine Dismantling			
006C	Install complete engine in engine overhaul stand.	I3	N/A	See Table 3, Groups 27, 34, and 35
007C	Separate reduction gear and torquemeter as an assembly from the power unit assembly leaving the torquemeter attached to the reduction gear section. Install the reduction gear/torquemeter assembly in the transportation and storage stand.	I3	N/A	See Table 3, Groups 26, 37, and 42
008C	Remove the torquemeter from the reduction gear at the safety coupling interface and install on plate and fixture. Then remove safety coupling from the reduction gear pinion shaft.	I3	N/A	See Table 3, Groups 26, 37, 44, 53, and 54
009C	Remove accessory drive section from the power unit assembly and install in its housing adaptor on the engine component stand.	I2	N/A	See Table 3, Group 7
010C	Remove turbine section (including combustion liner assembly) and install in engine component stand.	I3	N/A	See Table 3, Groups 26, 57, 61, 63, and 64

Req. Number	Requirement	Maintenance Level	Interval	GSE Requirement
011C	Install compressor section in engine component stand.	I2	N/A	See Table 3, Group 23
	Compressor Section			
012C	Remove, replace/install compressor extension shaft, housing and side gear.	I2	N/A	See Table 3, Groups 12 and 45
013C	Remove, replace/install compressor air inlet housing and air inlet vane.	I2	N/A	Pusher 6797664
014C	Remove, replace/install compressor front bearing and labyrinth seal.	I2	N/A	See Table 3, Groups 13, 14, and 16
015C	Remove/reinstall compressor case assembly.	I2	N/A	See Table 3, Groups 15 and 22
016C	Remove, replace/install compressor rotor and case assemblies.	I1	N/A	See Table 3, Groups 15, 19, 20 and 22
017C	Perform compressor blade and vane inspection.	I3	N/A	See Table 3, Groups 21 and 24
018C	Repair compressor blades and vanes. Rework is limited to minor nicks, scratches or abrasions in the leading and trailing edges which can be removed by light polishing.	I2	N/A	See Table 3, Group 11
019C	Remove, inspect, and replace/install compressor diffuser, rear bearing, and seal.	I2	N/A	See Table 3, Group 18

Req. Number	Requirement	Maintenance Level	Interval	GSE Requirement
	Turbine Change Assembly/Turbine Section (including Combustion Liner Assembly)			
020C	Perform rotor axial clearance check	I3*	N/A	See Table 3, Group 41
021C	Remove, clean, inspect, and replace/install combustion chamber outer casing.	I2	N/A	See Table 3, Groups 10 and 63
022C	Remove, clean, inspect, repair, and replace/install combustion liners. Repair consists of inert gas arc welding.	I2	N/A	See Table 3, Group 10
023C	Remove, clean, inspect, repair, and replace/install combustion chamber inner casing and inner casing liner.	I2	N/A	See Table 3, Groups 56 and 63
024C	Remove, replace/install turbine rear bearing, and rear bearing support and oil seal.	I2	N/A	See Table 3, Groups 57 and 63
025C	Remove, replace/install turbine front bearing support, bearing cage, bearing, and ring seals.	I2	N/A	See Table 3, Group 56
026C	Remove, replace/install turbine inlet casing.	I2	N/A	See Table 3, Group 63
027C	Remove, replace/install turbine stator vanes and vane casing.	I2	N/A	See Table 3, Group 63
028C	Remove, replace/install turbine front bearing inner ring and labyrinth seal.	I2	N/A	See Table 3, Group 56
029C	Remove, replace/install turbine rotor.	I2	N/A	See Table 3, Group 58
030C	Remove, inspect, replace/install inner front exhaust cone.	I2	N/A	

*May be accomplished at "O" level also

T56 Turboprop Engine
Nomenclature/Designation

Revision Number

Req. Number	Requirement	Maintenance Level	Interval	GSE Requirement
0031	Remove, replace/install rear bearing and rear bearing support.	I2	N/A	See Table 3, Group 57
0032	Remove, replace/install turbine coupling shaft.	I2	N/A	
	Accessory Drive Section			
033C	Remove, replace/install accessory drive section.	I2	N/A	See Table 3, Groups 7 and 17
034C	Remove/replace the following external components mounted on the accessory drive section: a. External scavenge oil pump[4,5] b. Speed sensitive valve c. Speed sensitive control d. Main engine oil pressure/scavenge pump e. Power unit oil filter f. Oil pressure regulating valve[1] g. Oil pressure reducing plug[2]	I3	N/A	Use common hand tools
035C	Inspect accessory drive shaft splines. No other maintenance is performed on the accessory drive section at the intermediate level. If accessory drive section is found faulty it is rejected as beyond capability of maintenance and forwarded to the depot for repair/overhaul.	I3	N/A	
036C	Drain, disassemble, clean, and inspect accessory drive section. Replace worn or damaged parts.	I2	N/A	See Table 3, Groups 1 through 7

T56 Turboprop Engine
Nomenclature/Designation

Revision Number

Req. Number	Requirement	Maintenance Level	Interval	GSE Requirement
	Torquemeter Section			
037C	Remove, replace/install torquemeter.	I3	N/A	See Table 3, Group 53
038C	Remove, clean, inspect, repair/install torquemeter anti-ice cowl assembly components.	I3	N/A	Common hand tools
039C	Remove, clean, inspect, replace/install torquemeter pickup assembly.	I3	N/A	See Table 3, Group 54
040C	Remove, replace/install torquemeter mid-bearing.	I2	N/A	See Table 3, Group 53
041C	Remove, clean, inspect, replace/install water/alcohol injection nozzles.[8]	I3	N/A	Water/alcohol alignment gage 6795789 (-10WA only)
	Reduction Gear Section			
042C	Remove, replace/install reduction gear section (including torquemeter and safety coupling).	I3	N/A	See Table 3, Group 42
043C	Remove/replace the following external reduction gear components:	I3	N/A	See Table 3 as required and use CET
	a. Reduction gear housing plugs[2]	I3	N/A	
	b. Reduction gear external pressure relief valve[1]	I3	N/A	See Table 3, Group 37
	c. Reduction gear lube pump/filter	I3	N/A	See Table 3, Group 43
	d. Reduction gear magnetic plug[2]	I3	N/A	
	e. Reduction gear magnetic plug housing[2]	I3	N/A	
	f. Reduction gear wiring harness	I3	N/A	
	g. Rear housing oil seals	I3	N/A	See Table 3, Group 43
	h. Feather solenoid[5]	I3	N/A	
	i. Thrust sensitive switch[3]	I3	N/A	Spring compressor 6796828
	j. Thrust sensitive actuator[3]	I3	N/A	Spring compressor 6796828
	k. Scavenge oil screen	I3	N/A

Revision Number

Req. Number	Requirement	Maintenance Level	Interval	GSE Requirement
044C	Inspect accessory shaft splines	I3	N/A	Internal spline gage 6872245
045C	Replace drain plug inserts	I2	N/A	See Table 3, Group 43
046C	Remove/replace propeller shaft oil seal	I3	N/A	See Table 3, Group 43
047C	Remove/replace propeller shaft plug	I3	N/A	See Table 3, Group 37
048C	Remove, replace/install propeller brake and starter gear	I2	N/A	See Table 3, Group 37
049C	Remove, replace/install bearing inner diaphragm	I2	N/A	See Table 3, Group 43
050C	Disassemble, clean and inspect reduction gear section -- replace worn or damaged parts (rear housing only -- no disassembly may be performed of front housing at the intermediate maintenance level).	I2	N/A	See Table 3, Groups 8, 9, 28 through 33, 36 through 43, and 46 through 51

T56 Turboprop Engine
Nomenclature/Designation

Revision Number

Req. Number	Requirement	Maintenance Level	Interval	GSE Requirement
	CORRECTIVE MAINTENANCE			
	Depot Level			
	Depot level maintenance consists of complete engine repair (CER) and overhaul (zero timing) capabilities. CER activities are similar to those conducted at the Il level; however, the depot has increased rework capabilities. In addition to those maintenance activities which are singular to the depot level, all intermediate activities can also be accomplished at the depot. Those activities which are singular to the depot level or require increased rework capabilities are covered in the following section.			
051C	Remove power unit assembly from shipping container, install into power unit assembly stand, dismantle into comprising work sections and install into appropriate workstands.	D	N/A	See Table 3 as required
052C	Remove, replace, disassemble, clean, inspect, adjust, repair/rework, overhaul, reassemble and install the following components as required:	D	N/A	See Table 4 as required, and use CET
	a. Burner drain valve	D	N/A	
	b. Coordinator control	D	N/A	See Table 4, Group 3
	c. Fuel control	D	N/A	See Table 4, Group 20
	d. Fuel control cutoff valve actuator	D	N/A	
	e. Fuel enrichment pressure switch	D	N/A	See Table 4, Group 4
	f. High pressure fuel filter	D	N/A	See Table 4, Group 5
	g. Low pressure fuel filter	D	N/A	
	h. Fuel filter pressure switch	D	N/A	See Table 4, Group 4
	i. Fuel hose assemblies[2]	D	N/A	
	j. Fuel manifold drain valve	D	N/A	
	k. Fuel spray nozzle assembly	D	N/A	See Table 4, Group 7
	l. Fuel pump	D	N/A	See Table 4, Group 21
	m. Speed sensitive control	D	N/A	See Table 4, Group 19

Req. Number	Requirement	Maintenance Level	Interval	GSE Requirement
	n. Temperature datum valve	D	N/A	See Table 4, Group 22
	o. Diffuser scavenge pump[9]	D	N/A	See Table 4, Group 8
	p. External oil scavenge pump[4]	D	N/A	See Table 4, Group 9
	q. Main engine oil pressure/scavenge pump	D	N/A	See Table 4, Group 10
	r. Power unit oil filter[2]	D	N/A	
	s. Turbine scavenge pump, front[9]	D	N/A	See Table 4, Group 12
	t. Turbine scavenge pump, rear	D	N/A	
	u. Ignition exciter	D	N/A	
	v. Ignition relay[2]	D	N/A	
	w. Power unit magnetic plug[2]	D	N/A	
	x. Power unit wiring harness assembly	D	N/A	See Table 4, Group 15
	y. Spark igniter plugs[2]			
	z. Anti-ice air hose assemblies[2]			
	aa. Anti-ice solenoid valve[5]			
	bb. Speed sensitive valve	D	N/A	See Table 4, Group 16
	Compressor Section			
053C	Disassemble and clean compressor section, visually inspect for worn or damaged parts.	D	N/A	See Table 5, Group 1, and use CET
054C	Perform magnetic inspection of the following compressor section parts: a. Tie bolts b. Nuts c. Gears d. Extension shaft	D	N/A	Magnetizer, demagnetizer

Req. Number	Requirement	Maintenance Level	Interval	GSE Requirement
055C	Perform fluorescent penetrant inspection of the following compressor section parts: a. Tie bolt (threaded or splined areas only) b. Diffuser assembly c. Air inlet housing assembly d. Extension shaft housing assembly e. Rear labyrinth seals f. Vane assemblies g. Wheel assembly	D	N/A	Ultraviolet light, air drier
056C	Remove/replace compressor section parts that are damaged, worn or out of tolerance.	D	N/A	See Table 5 as required, and use CET
057C	Remove and rework applicable compressor section parts by plating, welding and/or grinding as required.	D	N/A	Use CET
058C	Repair compressor side gear by: a. Rework gear bearing journal by grinding and chrome plating. b. Replace side gear and bearing retaining ring if worn beyond serviceable limits. c. Replace bearing cage if worn.	D	N/A	See Table 5, Group 8, and use CET
059C	Repair compressor extension shaft and housing by: a. Rework shaft by grinding and chrome plating. b. Rework housing by welding, or machining and spray metallizing as required. c. Replace housing and shaft if worn or damaged beyond serviceable limits.	D	N/A	Use CET

T56 Turboprop Engine
Nomenclature/Designation

Revision Number

Req. Number	Requirement	Maintenance Level	Interval	GSE Requirement
060C	Repair compressor air inlet housing by: a. Perform pressure test, no leakage allowed. b. Rework housing as required by welding and/or blending cracks, scratches, dents or oversized holes. c. Replace housing when serviceable limits are exceeded or practicable repair is prevented.	D	N/A	See Table 5, Group 2, and use CET
061C	Repair compressor air inlet vane assembly by: a. Rework vane assembly by welding, blending, or peening nicks and trailing edge cracks. b. Replace vane assembly by cutting and brazing.	D	N/A	See Table 5, Group 3, and use CET
062C	Repair compressor case assembly by:	D	N/A	See Table 5, Group 4, and use CET
	a. Rework case for cracks, scratches and dents by welding, blending or recoating.	D	N/A	
063C	Repair compressor vane assembly by: a. Rework vane assembly by blending, welding and ni-cad plating. b. Replace vane assembly if beyond serviceable limits. c. At each overhaul, replace air seals and perform seal break-in run during functional run of engine test.	D	N/A	Use CET
064C	Repair compressor seal assemblies by: a. Rework seals by relining solder seal. b. Replace seals if beyond serviceable limits.	D	N/A	See Table 5, Group 7, and use CET

T56 Turboprop Engine
Nomenclature/Designation

Revision Number

Req. Number	Requirement	Maintenance Level	Interval	GSE Requirement
065C	Repair compressor rotor assembly by: a. Rework rotor by grinding, plating, blending or reforming rotor blades, wheels and spacers. b. Replace rotor parts beyond serviceable limits. c. Perform static balance on wheels. d. Assemble rotor assembly. e. Perform dynamic balance on rotor assembly.	D	N/A	See Table 5, Group 6, and use CET
066C	Repair compressor diffuser assembly by: a. Perform diffuser pressure test. b. Rework diffuser by welding, blending, peening, grinding or ni-cad plating struts, rims or sleeve. c. Replace diffuser components as required.	D	N/A	See Table 5, Group 5, and use CET
067C	Repair compressor air bleed collectors by: a. Rework collectors by welding. b. Replace baffles and plug weld.	D	N/A	Use CET
068C	Reassemble compressor section and verify repairs. Turbine change assembly/turbine section (including combustion liner assembly)	D	N/A	Use CET
069C	Disassemble combustion liner assembly and clean, visually inspect for worn or damaged parts.	D	N/A	See Table 5, Group 9, and use CET
070C	Perform fluorescent penetrant inspection of the following combustion liner assembly parts: a. Inner Casing Assembly b. Outer Casing Assembly c. Inner Casing Liner Assembly d. Inner Exhaust Cone	D	N/A	Ultraviolet light, air drier

Req. Number	Requirement	Maintenance Level	Interval	GSE Requirement
071C	Repair/replace combustion liner assembly parts that are damaged, worn or out of tolerance.	D	N/A	Use CET
072C	Repair combustion chamber outer casing by: a. Rework casing by welding or coating. b. Rework casing holes by tapping. c. Replace casing beyond serviceable limits.	D	N/A	Use CET
073C	Repair combustion liners by: a. Rework liners by welding. b. Replace liners beyond serviceable limits.	D	N/A	See Table 5, Group 11, and use CET
074C	Repair combustion chamber inner casing by: a. Perform pressure test of inner casing. b. Rework casing by blending and welding. c. Replace casing if cracked in bellows area or beyond serviceable limits.	D	N/A	See Table 5, Group 10, and use CET
075C	Repair combustion chamber inner casing liner by: a. Perform inner casing liner pressure test. b. Rework casing liner by welding and blending. c. Replace casing liner if worn or damaged beyond serviceable limits.	D	N/A	See Table 5, Group 10, and use CET

Req. Number	Requirement	Maintenance Level	Interval	GSE Requirement
076C	Reassemble combustion liner assembly and verify repairs.	D	N/A	Use CET
077C	Disassemble and clean turbine section, visually inspect for worn or damaged parts.	D	N/A	See Table 5, Group 9
078C	Perform magnetic inspection of the following turbine section parts: a. Turbine coupling shaft assembly b. Turbine coupling shaft adapter c. Turbine clamp nuts d. Turbine rear scavenge oil pump assembly (shafts and gear assembly)	D	N/A	Magnetizer, demagnetizer
079C	Perform fluorescent penetrant inspection of the following turbine section parts: a. Turbine blades b. Turbine vane casing c. Turbine inlet casing d. Turbine coupling shaft (threaded or splined areas only) e. Turbine seal assemblies f. Turbine spacers g. Turbine bearing supports h. Turbine pump supports i. Turbine vane and seal support j. Turbine vane assemblies k. Turbine wheel assemblies	D	N/A	Ultraviolet light, air drier

Req. Number	Requirement	Maintenance Level	Interval	GSE Requirement
085C	Repair turbine inlet casing by: a. Rework casing by welding or blending. b. Replace loose or broken studs. c. Replace casing if beyond serviceable limits.	D	N/A	See Table 5, Group 14, and use CET
086C	Repair turbine vane casing by: a. Rework casing by welding or blending. b. Replace casing if beyond serviceable limits.	D	N/A	See Table 5, Group 17, and use CET
087C	Repair turbine rotor assembly by: a. Disassemble turbine rotor assembly. b. Rework turbine blades by light polishing, blending, grinding and ALPAK processing. c. Rework turbine wheels and spacers by blending, grinding, metalizing and polishing. d. Rework vane assembly by blending, welding, polishing and ALPAK processing. e. Replace turbine rotor parts which exceed serviceable limits. f. Static balance turbine wheels and spacers. g. Reassemble turbine rotor assembly. h. Dynamic balance turbine rotor assembly. i. Verify repair of turbine rotor assembly.	D	N/A	See Table 5, Group 16, and use CET

T56 Turboprop Engine
Nomenclature/Designation

Revision Number

Req. Number	Requirement	Maintenance Level	Interval	GSE Requirement
088C	Reassemble turbine section and verify repair.	D	N/A	Use CET
	Accessory drive section			
089C	Drain, disassemble and clean accessory drive section, visually inspect for worn or damaged parts.	D	N/A	See Table 5, Group 18, and use CET
090C	Perform magnetic inspection of the following accessory drive section components: a. Pressure and scavenge oil pump assembly parts b. External scavenge oil pump assembly parts	D	N/A	Magnetizer, demagnetizer
091C	Perform fluorescent penetrant inspection of the following accessory drive section parts: a. Accessory drive housing cover assembly b. Accessory drive housing assembly	D	N/A	Ultraviolet light, air drier
092C	Repair/replace accessory drive section parts which are worn, damaged or out of tolerance.	D	N/A	See Table 5 Group 18
093C	Repair accessory drive housing assembly by: a. Rework housing by grinding, welding, or machining and metallizing. b. Replace housing if beyond serviceable limits.	D	N/A	See Table 5, Group 18, and use CET

Req. Number	Requirement	Maintenance Level	Interval	GSE Requirement
094C	Repair accessory drive housing gears and shaft gears by: a. Rework bearing journals by grinding and chrome plating. b. Rework gears by light stoning of minor nicks and scratches. c. Replace gears if cracked, spalled, chipped or bent.	D	N/A	See Table 5, Group 18, and use CET
095C	Reassemble accessory drive section, and verify repairs. Torquemeter section	D	N/A	
096C	Remove, disassemble, clean, inspect, adjust, repair/rework, replace, reassemble and install the following components as required: a. Water/alcohol injection manifold[8] b. Water/alcohol injection nozzles[8] c. Torquemeter sensing pickup[2]	D	N/A	Use CET
097C	Disassemble and clean torquemeter section, visually inspect for wear and/or damage.	D	N/A	See Table 5, Group 19, and use CET
098C	Perform magnetic inspection of the following torquemeter section parts: a. Torquemeter coupling b. Lock nut c. Safety coupling members d. Shaft assembly, inner and outer	D	N/A	Magnetizer, demagnetizer

Req. Number	Requirement	Maintenance Level	Interval	GSE Requirement
099C	Perform fluorescent penetrant inspection of the torquemeter housing.	D	N/A	Ultraviolet light, air drier
100C	Repair torquemeter housing assembly by: a. Rework housing by blending nicks. b. Replace housing if cracked, dented or exceeds serviceable limits.	D	N/A	Use CET
101C	Repair torquemeter inner and outer shafts by: a. Rework shaft teeth by welding and machining. b. Rework shaft by vapor blasting, stoning. c. Rework splines by blending. d. Replace shafts if beyond serviceable limits.	D	N/A	See Table 5, Group 20, and use CET
102C	Balance torquemeter shaft and safety coupling assembly.	D	N/A	See Table 5, Group 21
103C	Reassemble torquemeter section and verify repair.	D	N/A	
	Reduction gear section			
104C	Remove, disassemble, clean, inspect, adjust, repair/rework, replace, reassemble and install the following components: a. Reduction gear lube pump/filter b. Reduction gear scavenge pumps	D	N/A	See Table 4 as required, and use CET See Table 4, Group 17 See Table 4, Group 18

Req. Number	Requirement	Maintenance Level	Interval	GSE Requirement
105C	Disassemble and clean reduction gear section, visually inspect for wear and damage.	D	N/A	See Table 5, Group 22, and use CET
106C	Perform magnetic inspection of the following reduction gear section parts: a. Planet gear carrier b. Reduction gear eyebolt c. Gears d. Sun gear hub e. Propeller brake outer member f. Propeller shaft assembly g. Coupling shaft	D	N/A	Magnetizer, demagnetizer
107C	Perform fluorescent penetrant inspection of the following reduction gear section parts: a. Inner rear housing diaphragm assembly b. Main diaphragm assembly c. Reduction gear eyebolt (threaded areas only) d. Planet gear and bearing journal (threaded areas only) e. Front and rear housing assemblies f. Bearing separators g. Propeller shaft (threaded areas only) h. Pinion spur shaft gear (threaded areas only)	D	N/A	Ultraviolet light, air drier
108C	Repair/replace reduction gear parts which are worn, damaged or out of tolerance.	D	N/A	Use CET

MAINTENANCE PLAN

PART III – MAINTENANCE REQUIREMENTS (continued)

T56 Turboprop Engine
Nomenclature/Designation

Revision Number

Req. Number	Requirement	Maintenance Level	Interval	GSE Requirement
109C	Repair reduction gear housings, front and rear, by: a. Rework housings by grinding, milling, welding, blending, and/or metallizing. b. Replace bearing cages, bushings and inserts as required. c. Replace housing if cracked in stress areas or exceeds serviceable limits.	D	N/A	See Table 5, Group 26, and use CET
110C	Repair propeller brake by: a. Rework brake by grinding, chrome plating, vapor blasting or polishing. b. Replace brake members if beyond serviceable limits. c. Replace outer member lining at each overhaul. d. Balance propeller brake. e. Assemble propeller brake. f. Test propeller brake.	D	N/A	See Table 5, Group 25, and use CET
111C	Repair gears, shafts, and bearings by: a. Rework gears by light stoning and polishing or grinding. b. Rework journals by grinding and plating. c. Replace bushings if beyond serviceable limits. d. Replace gears if beyond serviceable limits. e. Balance gears.	D	N/A	See Table 5, Group 24, and use CET
112C	Reassemble reduction gear assembly and verify repair.	D	N/A	See Table 5, Group 23, and use CET

TABLE 2 - TOOL GROUP LIST FOR T56 ENGINE, ORGANIZATIONAL LEVEL MAINTENANCE

GROUP	NOMENCLATURE	PART NUMBER
1	OPERATIONAL CHECK AND TROUBLESHOOTING	
	Adapter, Torque, Reduction gear filter	6796891
	Borescope, 1st-stage turbine vanes	6798917
	Borescope, 1st-stage turbine vanes and thermocouple viewing (-10WA, and -14)	6797314
	Borescope, 1st-stage turbine vanes without disassembly	6796572
	Cable, Adapter, Electrical components checkout test set (-10WA, and -14)	6799150
	Cable, Adapter, Torquemeter runout (use with 6893546 test set)	6893705
	Cable, Adapter, Torquemeter runout (-7A, -16, and -423)	6799877
	Cable Assy, Temp trim system test set (-7A, -15, and -423)	6799217
	Cable Assy, Temp trim system test set (-425, and -426)	6799297
	Cable Assy, Temp trim system test set (-10WA, and -14)	6799216
	Cable, Power Adapter (-426)	6798141
	Cable Set, Temperature indicator checking	6799881
	Calculator, Engine performance (-7A, -10WA, and -426)	6795880
	Calculator, Engine performance (-7A, -14, -16, -423, and -425)	6799970
	Calculator, Engine performance (-10WA, and -14)	6796953
	Calculator, Minimum power (-7A, -16, and -423)	6796785
	Calculator, Minimum power (-425, and -426)	6796960
	Cover, Main oil filter	6798246
	Cover, Reduction gear oil filter (-425, and -426)	6798247
	Depressor, Spring, Fuel filter element	6796975
	Expander, Accessory drive shaft oil seal	6796355
	Expander, Propeller shaft thrust bearing seal	6796651
	Expander, Switch drive shaft oil seal	6796588
	Expander, Tach drive shaft oil seal	6796354
